

XP0 Use in 4 Cycle Karting Engines

Due to the ultra-low viscosity of XP0, it should only be used in 4 cycle karting engines with babitt style bearing inserts. Do not use the XP0 in engines with stock aluminum rods without bearing inserts. The ultra-low viscosity formula of XP0 does not provide enough protection for the aluminum rods without a bearing insert. XP0 works extremely well and provides a performance advantage in 4 cycle karting engines with bearing inserts.
